

Extension Pins for Enfusion[®] Hand Held Control Unit

The Enfield™ joint achieves the optimum level of performance where it matters most – at the fittingsocket/pipe-spigot interface.

Proper installation is key to producing a reliable and long lasting piping system. If the installation is not done correctly, the system will not perform well and may actually fail.

Features and Benefits:

- Extension pin allows joints to be fused closer to an obstruction or wall
- Pins are re-usable

Extension pin extends beyond the protective feature allowing joints to be fused closer to the wall.

Extension pin allows joints to be fused closer to the wall

Protective Feature

Introducing the Extension Pins

Enfield fittings are designed with raised features to protect the fusion pins – this has at times made it difficult to fuse joints near a wall or obstruction.

With these extension pins, the height of the pin is elevated above the protective feature allowing the lead to rotate further; thus, allowing joints to be fused while closer to an obstruction or wall.
